

## nanDECK - Tutorial G - Keyword Wizard

Starting from nanDECK version 1.11 you can use a template wizard for inserting keywords.

In the main editor, if you want to insert a directive, right click on an empty row and a menu appears, with all the keywords:

For every keyword, a different wizard form appears, with all the parameters. The same windows appears if you press F2 (modify) on a compiled row. For example this is the RECTANGLE form:

The image shows a 'RECTANGLE' dialog box with a blue title bar and standard window controls. It contains several input fields and buttons for configuring a rectangle. The fields are: 'Range' (a single input), 'X pos' (input), 'Y pos' (input), 'Width' (input), 'Height' (input), 'Color' (input with 'Pick a color' and 'Pick a gradient' buttons), 'Color' (input with 'Pick a color', 'Pick a gradient', and 'EMPTY' buttons), and 'Thickness' (input). A 'Pick rect.' button is located next to the 'Height' field. At the bottom, there is a text area containing a syntax hint, and three buttons: 'Confirm', 'Help (F1)', and 'Cancel'.

Range

X pos  Y pos  Width  Height

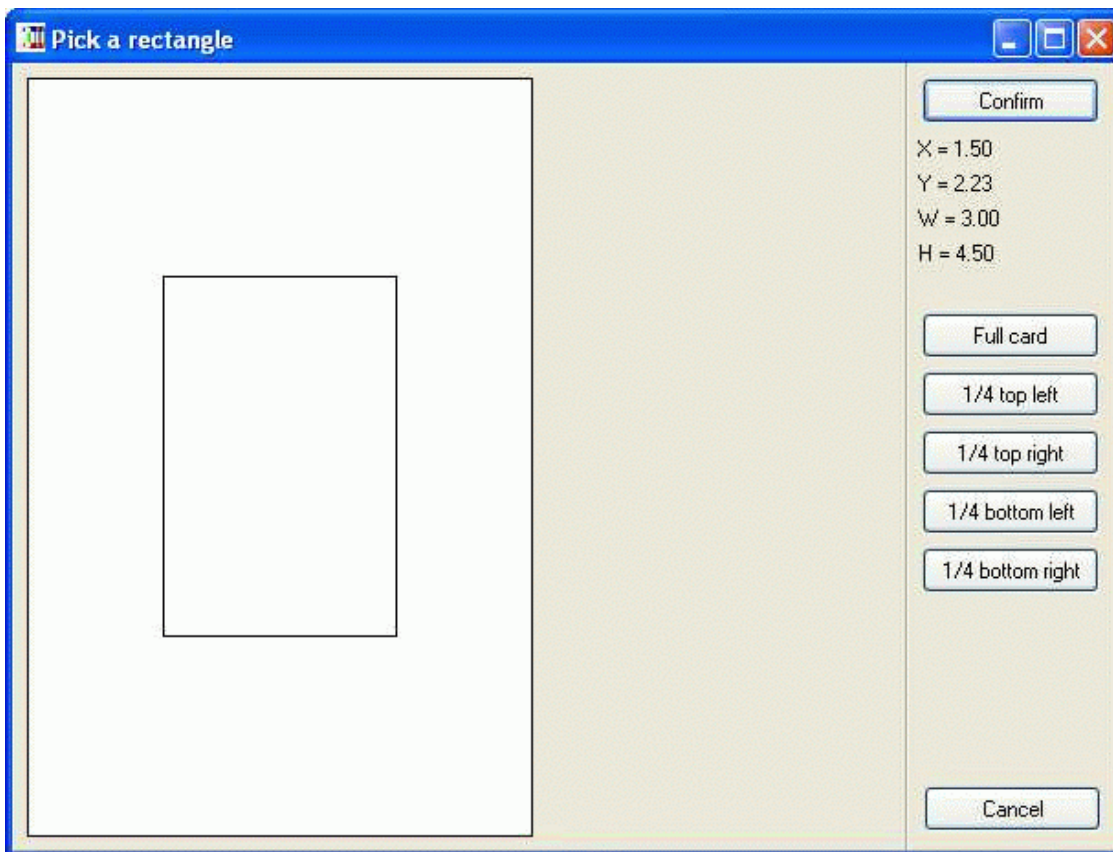

Color

*Color*

*Thickness*

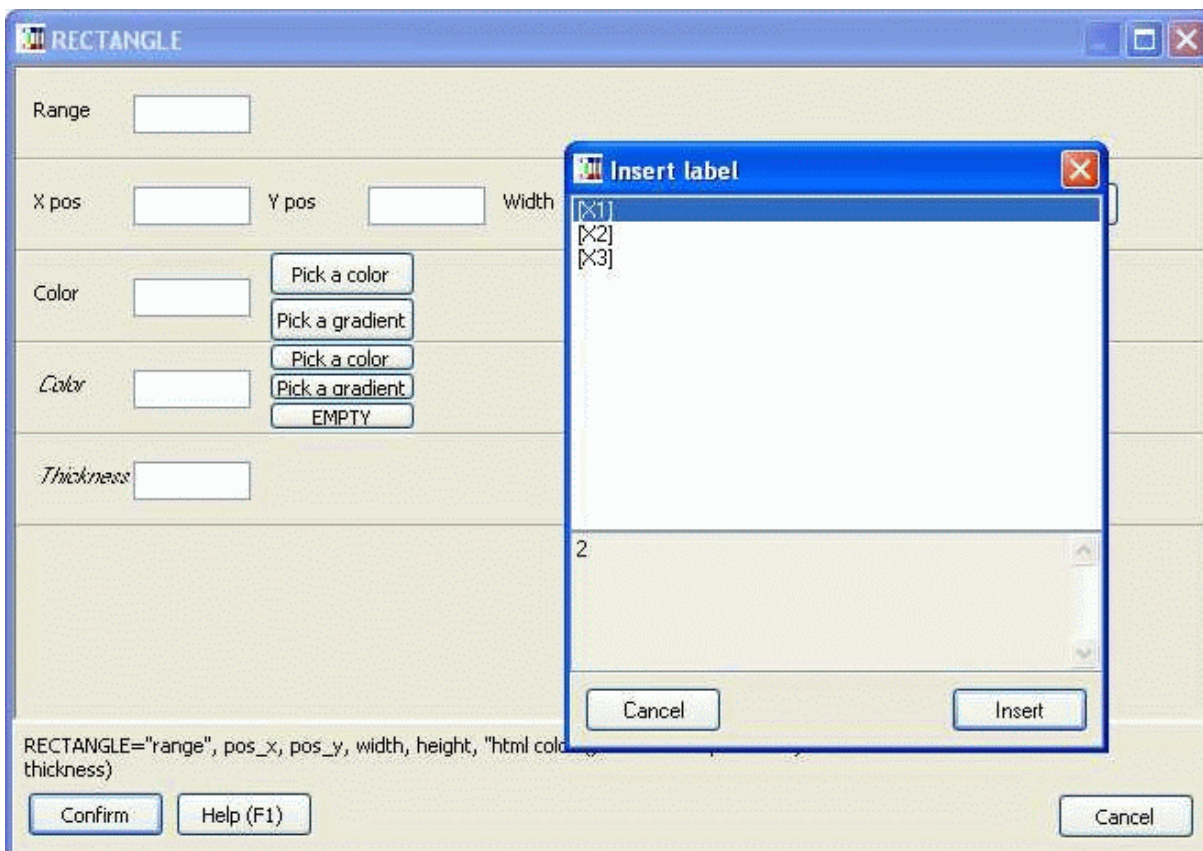

RECTANGLE="range", pos\_x, pos\_y, width, height, "html color"({, "html color" | "EMPTY",  
thickness)

Optional parameters are in *italic* (like *Thickness*). A hint for the syntax is show in the bottom of the form, with the **Confirm**, **Help** (it points to the RECTANGLE page) and **Cancel** buttons. For some parameters there are buttons for inserting specific values (like colors and gradients). For position and size there is a specific form ("**Pick rect.**" button):

The center rectangle can be moved and resized with the mouse.

In the wizard form, if you double click in a field, you can choose a label from a list (with the label's content):

Bye,  
/and

---
